

Adding and Subtractions Fractions

- ① Make sure both fractions have common denominators
- ② Add or subtract numerators only.
Denominators stay the same.
- ③ Simplify.

$$\text{Ex. } \frac{1}{10} + \frac{7}{10} = \frac{1+7}{10} = \frac{8 \div 2}{10 \div 2} = \boxed{\frac{4}{5}}$$

$$\text{Ex. } \frac{3 \times 2}{8 \times 2} + \frac{11}{10}$$

$$\frac{6}{16} + \frac{11}{16} = \frac{17}{16} = \boxed{1 \frac{1}{16}}$$

$$\text{Ex. } \frac{2 \times 4}{3 \times 4} - \frac{1 \times 3}{4 \times 3}$$

$$\frac{8}{12} - \frac{3}{12} = \boxed{\frac{5}{12}}$$
